COVID-19 UPDATE

City Reports Another Triple-Digit Spike, Urges Residents to Take Safety Precautions

EL PASO, Texas—Today the City of El Paso Department of Public Health (DPH) is reporting **one (1)** death and **265** new COVID-19 positive cases.

The death was a female in her 80s with underlying health conditions bringing the total number of deaths to 132.

Health officials advised they are investigating the latest increase, and initial reports indicate the majority are likely owing to community spread. However, portions of the spike appear to be due in part to additional cases among existing clusters in a detention facility and an elderly care facility.

“The consistent jump in positive cases lately is alarming, and calls for everybody to once again devote themselves to strictly practice the recommended safety precautions to slow the spread in our community,” said City-County Local Health Authority Dr. Hector Ocaranza. “While the Fourth of July is fast approaching we want to remind the community that social gatherings of more than ten people are prohibited. Again, I ask you to limit going out, but if you must go out please practice social distancing, wear a face cover, frequently wash your hands with soap and water and if you’re feeling even mildly under the weather stay home.”

The City’s epidemiology team, including contact tracing, conduct ongoing investigations in an effort to stop the spread from those currently and potentially infected, and to inform the public about other public health prevention measures implemented to reduce the spread of COVID-19.

The community also is reminded that there is currently no vaccine to prevent COVID-19. Additionally, it is estimated that more than 20 percent of the total positive cases are asymptomatic, meaning the COVID-19 positive individuals showed no symptoms and, if they did not following preventive measures may have infected those around them.

At this time, the best way to prevent illness is to avoid exposure to this virus. According to the Centers for Disease Control and Prevention the virus mainly spreads via person-to-person contact:

- Between people who are in close contact with one another (within 6 feet);
- Through respiratory droplets produced when an infected person coughs, sneezes or talks;
- These droplets can land in the mouths or noses of people who are nearby and possibly be inhaled into the lungs.
